Apple

Dear Hiring Team,

I am writing to apply for the Swift Testing Frameworks Engineer position. My career has been centered on building, evolving, and teaching automated testing systems for Apple platforms, with deep hands-on experience in XCTest, XCUITest, Swift, Objective-C, and large-scale developer tooling environments.

In my current role as Principal Software Engineer for iOS Checkout at Walmart, I own the testing strategy and infrastructure for one of the highest-traffic consumer iOS applications in production. I established and scaled comprehensive automated testing across unit, integration, and UI layers using XCTest and XCUITest, increasing coverage to approximately 85% and materially reducing post-release defects. This work required close collaboration with platform, CI/CD, accessibility, and release engineering teams—an operating model very similar to how Apple's Developer Tools teams partner across the organization.

Beyond implementation, I have spent many years focused on testing frameworks as a discipline. I have delivered conference and community talks on XCTest, TDD, BDD, mocking, MVVM-style architectures, and testability at venues including CocoaConf, 360iDev, Cincinnati CocoaHeads, and CocoaHeads conferences. These presentations reflect not only practical experience, but also a sustained interest in API design, developer ergonomics, and teaching testing concepts clearly—concerns that are central to maintaining core frameworks like XCTest and Swift Testing.

Earlier in my career, I built and maintained distributed systems in Java and J2EE, which informs how I reason about determinism, isolation, concurrency, and reliability—qualities that are essential when designing testing infrastructure intended to run consistently across macOS, iOS, Linux, Windows, and other platforms.

What particularly draws me to this role is the opportunity to work on foundational testing frameworks used by the entire Swift ecosystem. I am comfortable engaging with engineers across teams, reviewing and shaping APIs with long-term stability in mind, and participating constructively in technical discussions within the open-source community. My background as both a practitioner and trainer positions me well to contribute to Swift Testing and swift-corelibs-xctest in a way that balances correctness, performance, and developer experience.

I would welcome the opportunity to bring my testing-focused background, platform experience, and community involvement to Apple's Swift Testing team. Thank you for your time and consideration.

Sincerely,
Douglas W. Sjoquist
