Bitwarden

Dear Engineering Team,

I am writing to apply for the Senior Software Engineer II (Mobile) role at Bitwarden. My background building and operating high-reliability, security-sensitive mobile platforms at scale aligns closely with your mission to deliver secure, open solutions for credential management.

I am currently a Principal Software Engineer at Walmart, where I lead iOS checkout platform development for Walmart's flagship e-commerce app. I was a key engineer in building our modern iOS codebase from the ground up over the past several years. My responsibilities include setting architecture and quality standards across multiple teams, providing technical leadership and deep involvement in code reviews, mentoring engineers, maintaining feature parity across multiple client surfaces, and driving improvements in testing, reliability, and release practices. I have extensive experience with modern iOS architecture, unit and UI testing, incremental modernization of mature codebases, and operating production systems with a strong focus on performance, stability, and user trust.

Bitwarden's emphasis on security, open-source collaboration, and a strong user community interests me. I have spent much of my career working in highly collaborative, distributed teams, helping others navigate complex technical problems, and raising the bar on engineering practices through shared ownership of the codebase. I would welcome the opportunity to become a long-term contributor to Bitwarden's iOS application, help strengthen its architecture and testing culture, and support the community contributions that are central to your platform.

Thank you for your consideration,

Doug Sjoquist
