Builder.io

Dear Builder.io Team,

I am applying for the Senior Software Engineer role on the Fusion team. Builder.io is not an abstract interest for me. I use Builder.io in production at Walmart and was part of the working group that helped integrate it into the iOS development workflow across the organization. That experience gave me a firsthand view of both the power of Builder.io's approach and the real engineering challenges involved in bridging design, product intent, and large-scale codebases.

At Walmart, I serve as Principal iOS Engineer for checkout, leading development and delivery of checkout features for one of the highest-volume consumer transaction systems in the world. I worked daily at the intersection of product, design, and engineering—translating ambiguous requirements into reliable systems, shaping solutions based on technical feasibility, and operating full-cycle ownership from early exploration through production validation. Integrating Builder.io into a complex enterprise environment required exactly the kind of “code-as-data” thinking your Fusion team describes: understanding existing architectures, CI/CD constraints, developer workflows, and reliability requirements, while making those systems accessible to non-mobile specialists.

Much of my career has centered on bridging intent and execution. I have built and governed developer platforms, defined engineering standards, led multi-team adoption of new workflows, and partnered closely with non-engineering stakeholders to shorten feedback loops between idea, implementation, and real-world impact. Whether modernizing legacy Objective-C systems, designing unidirectional reactive architectures, or raising automated test coverage and observability across large organizations, my focus has consistently been on enabling others to ship high-quality product faster, not just writing code in isolation.

Although my most recent work has been mobile-focused, my background spans full-stack and distributed systems development, including many years building Java-based enterprise and web systems before specializing in iOS. The Fusion role's emphasis on external codebases, system integration, and customer-driven engineering aligns closely with how I have operated in both enterprise and consulting environments: high agency, technically rigorous, and grounded in direct customer and stakeholder feedback.

Builder.io's work in visual development, AI-assisted code generation, and real-code integration addresses one of the most persistent friction points in software delivery. Having already partnered with Builder.io from the customer side, I am excited by the opportunity to contribute from the inside—helping shape a product that makes complex development ecosystems accessible, reliable, and genuinely empowering across entire organizations.

Thank you for your time and consideration. I would welcome the opportunity to discuss how my background in platform engineering, product-adjacent development, and Builder.io adoption at scale could contribute to the Fusion team.

Sincerely,
Doug Sjoquist
