Ramp

Dear Nikita,

I'm reaching out regarding the iOS Engineer role. Ramp's focus on building an intelligent financial operations platform is the type of product environment where my background fits well—mobile engineering at scale, clear architecture, and steady delivery in fast-moving conditions.

In my current role at Walmart, I lead iOS checkout development for a high-traffic eCommerce platform, set coding standards, and mentor engineers across a large team. Our codebase maintains 99.9%+ crash-free sessions while supporting continuous feature work through high test coverage (85%+), structured integration and regression testing, and consistent manual and AI-augmented code reviews.

I'm comfortable balancing reliability with rapid iteration, and I work closely with product and design partners to translate requirements into practical, maintainable solutions.

Alongside my enterprise experience, I've developed more than twenty custom iOS apps independently, which keeps me grounded in shipping features end-to-end—from architecture and implementation through testing and App Store management. My work at McGraw Hill integrating analytics tools and building automation also aligns with Ramp's interest in AI-driven and intelligent workflows. At Walmart, I've contributed to initiatives evaluating and integrating AI tools into our engineering processes. I also have hands-on experience experimenting with SwiftUI and TCA in personal projects, and our teams have begun incorporating SwiftUI into new components.

I would welcome the chance to contribute to Ramp's mobile platform and help build the next set of products on top of it. Thank you for your time, and I look forward to the possibility of talking further.

Thank you,
Doug Sjoquist
