Reddit

Dear Hiring Team,

I am writing to express interest in joining Reddit's iOS Platform team. Throughout my career, my work has centered on building and evolving the technical foundations that enable large iOS organizations to move faster, ship safely, and scale with confidence—precisely the mission described for this role.

Most recently, as Principal iOS Engineer responsible for Walmart's checkout platform, I owned the architecture and long-term technical direction for one of the highest-volume consumer iOS experiences in the world. My focus was not only on shipping features, but on strengthening the platform itself: defining architectural standards, improving build and release reliability, and enabling dozens of engineers across teams to work productively in a shared codebase. This included leading modularization efforts, designing unidirectional reactive systems in Swift and Combine, and establishing rigorous practices around performance, observability, testing, and CI/CD.

A consistent theme in my work has been balancing the needs of other engineers as well as the product. I have served as the escalation point for complex iOS problems, led cross-team architectural reviews, and driven initiatives that improved developer velocity while maintaining high standards for correctness and reliability. Instrumenting core flows to achieve sustained 99.9%+ crash-free sessions and raising automated test coverage to materially reduce regressions are examples of platform investments that paid dividends well beyond any single feature delivery.

Reddit's emphasis on owning core infrastructure—such as networking, caching, build tooling, and shared frameworks—strongly resonates with my background. I am particularly motivated by roles where success is measured by how effectively the platform enables future product teams to innovate. I enjoy operating in ambiguous spaces, prototyping and validating approaches, and then carrying solutions through to production and continuous iteration.

Beyond large-scale platform leadership, my long history of independent iOS consulting has given me a strong product mindset and appreciation for pragmatic trade-offs. Working across healthcare, education, and consumer applications has reinforced the importance of designing flexible, well-documented systems that scale across teams and use cases.

I would welcome the opportunity to contribute to Reddit's iOS technical foundation and collaborate with the engineers who build experiences used by millions every day. Thank you for your time and consideration.

Sincerely,
Doug Sjoquist
